

MagicMirror² Cheatsheet

Zotac ZBOX-PI335 — mirror.local — 192.168.20.86

Username	mirror
Password (sudo)	toor
IP Address	192.168.20.86
Hostname	mirror.local
MM ² Web	http://192.168.20.86:8080
Remote Control	http://192.168.20.86:8080/remote.html
Config Portal	http://192.168.20.86:8081

PHYSICAL CONTROLS — KEYBOARD ON THE MIRROR

Key Combo	What it does
Ctrl + Alt + F2	Switch to TTY console (text login). Login as mirror.
Ctrl + Alt + F7	Switch back to graphical session
Ctrl + M	Minimise MM ² Electron window (when MM ² is focused)
Ctrl + R	Reload MM ² without full restart
Ctrl + Q	Quit Electron / MM ²
Double-click 'Stop Mirror'	Kill MM ² + Weston, restore XFCE desktop
Double-click 'Start Mirror'	Restart MM ² in fullscreen kiosk mode
Double-click 'Terminal'	Open xfce4-terminal
Double-click 'Firefox'	Open Firefox browser

CONTROLLING FROM YOUR PHONE

URL	Purpose
192.168.20.86:8080	View the mirror display in browser
192.168.20.86:8080/remote.html	Full Remote Control — modules, config, brightness, restart
192.168.20.86:8081	WiFi config portal — change network, see status, reboot

SERVICE CONTROL — TERMINAL COMMANDS

Command	What it does
systemctl --user status magicmirror	Check if MM ² is running
systemctl --user restart magicmirror	Restart MM ²
systemctl --user stop magicmirror	Stop MM ² (Weston also dies)
systemctl --user start magicmirror	Start MM ²
journalctl --user -u magicmirror -n 30	View last 30 lines of MM ² logs
journalctl --user -u magicmirror -f	Follow MM ² logs live (Ctrl+C to exit)
sudo reboot	Reboot the mirror
sudo shutdown now	Shut down the mirror

EDITING THE CONFIG

The main config is at `~/MagicMirror/config/config.js` which is a symlink to `config-guest.js`. After ANY edit, restart MM² for changes to apply.

File	Purpose
<code>~/MagicMirror/config/config.js</code>	Active config (symlink)
<code>~/MagicMirror/config/config-guest.js</code>	Guest profile — clock/weather/news
<code>~/MagicMirror/config/config-personal.js</code>	Personal profile — adds crypto/stats
<code>~/MagicMirror/css/custom.css</code>	Global styles + portrait rotation
<code>~/MagicMirror/modules/</code>	All installed modules live here

WHERE THINGS LIVE IN config-guest.js

What you want to change	Where in config	Notes
Clock 12/24 hour	<code>timeFormat: 24</code>	Top of file. Change to 12 for AM/PM
Units (metric/imperial)	<code>units: "metric"</code>	Top of file
Language	<code>language: "en"</code>	Top of file
Add Google Calendar	<code>module: "calendar"</code>	Add new entry to <code>calendars: [...]</code>
Weather location	<code>lat / lon in weather</code>	Both current and forecast modules
News sources	<code>module: "newsfeed"</code>	Add to <code>feeds: [...]</code> array
BTC update interval	<code>module: "MMM-BTCAud"</code>	<code>updateInterval</code> in milliseconds
BTC chart size	<code>module: "MMM-BTCAud"</code>	<code>chartWidth / chartHeight</code> in pixels
Module position	<code>position: "top_right"</code>	<code>top/middle/bottom + left/center/right</code>
Allowed IPs	<code>ipWhitelist: []</code>	Empty array = allow all

MODULE POSITIONS (in landscape — your screen is rotated 90°)

<code>top_left</code>	<code>top_center</code>	<code>top_right</code>
<code>top_bar (full width)</code>		
<code>upper_third</code>	<code>upper_third</code>	<code>upper_third</code>
<code>middle_center</code>	<code>middle_center</code>	<code>middle_center</code>
<code>lower_third</code>	<code>lower_third</code>	<code>lower_third</code>
<code>bottom_bar (full width)</code>		
<code>bottom_left</code>	<code>bottom_center</code>	<code>bottom_right</code>

COMMON EDITS — COPY/PASTE READY

Add a Google Calendar: Go to Google Calendar → Settings → your calendar → Integrate calendar → copy 'Secret address in iCal format'. Then in config, find the `calendars: [...]` block and add:

```
{
  symbol: "calendar",
  url: "PASTE_YOUR_GOOGLE_ICAL_URL_HERE"
},
```

Add a news source: In the newsfeed module, add to `feeds: [...]`:

```
{
  title: "BBC News",
  url: "http://feeds.bbc.co.uk/news/rss.xml"
},
```

Change BTC update frequency to every minute:

```
updateInterval: 60 * 1000,    // 60 seconds in MMM-BTCAud config
```

INSTALLING NEW MODULES

Option 1 — From your phone (easiest):

Open 192.168.20.86:8080/remote.html, go to MagicMirror Modules → Install. Browse, search, install in one click.

Option 2 — From terminal with mmpm:

```
mmpm search bitcoin
mmpm install MMM-cryptocurrency
mmpm list --installed
mmpm remove MMM-cryptocurrency
mmpm update
```

Option 3 — Manual git clone:

```
cd ~/MagicMirror/modules
git clone https://github.com/USER/MMM-MODULE.git
cd MMM-MODULE && npm install --production
# Then add to config-guest.js modules array
systemctl --user restart magicmirror
```

WIFI / NETWORK CHANGES

If the mirror moves to a new house or the WiFi changes, the WiFi watchdog creates a setup hotspot automatically:

Step	What to do
1	Mirror can't find HAL9000 → creates hotspot 'MirrorSetup'
2	On your phone, connect to WiFi: MirrorSetup (password: mirror123)
3	Browse to http://192.168.4.1:8081
4	Enter new SSID + password, optionally set static IP
5	Mirror connects and resumes normal operation

Or change WiFi from terminal:

```
nmcli device wifi list
nmcli device wifi connect "SSID" password "your_password"
~/mm-wifi.sh "SSID" "password"      # easier wrapper script
```

PROFILE SWITCHING

Two configs exist: quest (default — clock/weather/news/btc) and personal (adds crypto/system stats when uncommented). Switch with:

```
~/mm-profile.sh quest
~/mm-profile.sh personal
~/mm-profile.sh      # show current profile
```

TROUBLESHOOTING

Problem	Fix
Black screen on boot	Ctrl+Alt+F2 → check 'systemctl --user status magicmirror'
MM² won't start	journalctl --user -u magicmirror -n 30 — read the error
Config syntax error	cd ~/MagicMirror && node --run config:check
Module not loading	Check it's in modules array, restart MM², check logs
Wrong rotation	Edit ~/MagicMirror/css/custom.css — flip 90deg ↔ -90deg
Forgot password	Boot to recovery, root shell, passwd mirror
Need to escape kiosk	Double-click 'Stop Mirror' on desktop
Lost network	Ctrl+Alt+F2, check 'ip -br addr', restart NetworkManager
Update everything	~/mm-update.sh (also runs weekly via cron)
Backup config	cp ~/MagicMirror/config/config-guest.js ~/backup-\$(date +%F).js

YOUR CUSTOM MODULE: MMM-BTCAud

Custom-built BTC/AUD module with 7-day chart. Located at ~/MagicMirror/modules/MMM-BTCAud/. Pulls data from CoinGecko's free API (no key needed). Updates every 5 minutes. All colours inherit from MM² global setting.

File	Purpose
MMM-BTCAud.js	Main module — DOM rendering, chart canvas drawing
node_helper.js	Backend — fetches data from CoinGecko API
MMM-BTCAud.css	Styles — all use color: inherit
